An Example of Game Theory-based Approach. Let's start with a simple example: spam detection. The following section describes the game-theoretical model developed for adversarial learning by W. Liu and S. Chawal in the paper. General Setting. It can be modeled as a 2-player game between the Spammer (S) and the Defender (D).

The main thesis advanced is that game theory can unify many seemingly diverse approaches to this basic problem. Part III, Cooperative Models of Closed Economic Systems, deals with the relationship between the Edgeworth and other cooperative approaches and the general equilibrium model of a completely closed economy, with both buyers and sellers.

Quasi-Streaming Graph Partitioning: A Game Theoretical Approach Abstract: Graph partitioning is a fundamental problem to enable scalable graph computation on large graphs. Existing partitioning models are either streaming based or offline based. In the streaming model, the current edge needs all previous edges' partition choices to make a decision.

A Game Theoretical Approach to Private Tutoring in South Korea\*. Ji-Ha Kim†. Department of Education, Yonsei University, South Korea. July, 2007. Abstract. This paper attempts to develop game theoretical models of parents' decision-making on the consumption of private tutoring (PT). From the individual decision maker's perspective, investment in PT guarantees a high private rate of return, while from the country's viewpoint, PT entails a low social rate of return with substantial ...

A game theory approach to radar ECCM evaluation - NASA/ADS. The evaluation of candidate ECCM features in a military radar should be an important part of the design process. In spite of its importance, a well-founded quantified methodology has not hitherto been developed. Here, the application of game theory is introduced as a powerful approach to ECCM appraisal.

Abstract. The current study examines hacktivism (i.e., hacking to convey a moral, ethical, or social justice message) through a general game theoretic framework - that is, as a product of costs and benefits. Given the inherent risk of carrying out a hacktivist attack (e.g., legal action, imprisonment), it would be rational for the user to weigh these risks against perceived benefits of carrying out the attack.
