In our early work, we have built a general framework “robust encoding of local ordinal measures” to unify several top iris recognition algorithms. Therefore the results reported in this paper improve state-of-the-art iris recognition performance essentially as well as evolve the framework from pair-wise local ordinal relationship to non-local ordinal

recognition systems is measured using segmentation.

Segmentation is used to localize the correct iris region in the particular portion of an eye and it should be done accurately and correctly for removing the eyelids, eyelashes, reflection, and pupil noises present in the iris region.
