ordination of relays with appropriate relay settings is to be done. Relay settings are done in such a way that proper co-ordination is achieved along various series network. Relay co-ordination can be done by selecting proper plug setting and time multiplication setting of the relay, considering maximum fault current at the relay location.

COORDINATION TECHNIQUE Precise overcurrent relay usage asks for the knowledge of the short circuit current that can flow in each section of the power network. Since large-scale measurements and tests are typically unfeasible, system calculations have to be used. The information needed for a relay protection setting analysis is:

### **Overcurrent Protection Fundamentals R**

For LRG medium voltage systems, a minimum delay of 0.35 seconds is chosen for electromechanical relays and 0.30 seconds for static relays to allow coordination with the motor relays that are typically set with a 0.05 second delay.
